Education

High School Integrated with Computer Technician — IFPI

Feb. 2024 - 2026

Computer Technician

Picos, Piauí

Relevant Courses

- Data Structures
- Algorithm Analysis
- Databases
- Robotics
- Networks
- Artificial Intelligence

Professional Experience

Nova Sinalização

Feb. 2026 – Currently

Young Apprentice Computer Technician

Picos, PI

- Developed scripts and algorithms in **Python** using **Google Colab** for task automation and analysis of the company's operational data.
- Performed preventive and corrective hardware maintenance, ensuring the availability of workstations and peripherals for employees.
- Assisted in the configuration and monitoring of the local network infrastructure, including router management, structured cabling, and IP addressing.
- Developed a desktop application in Python to automate the extraction and structuring of data from KML files, generating formatted XLSX spreadsheets for analysis and data processing.

Main Projects

Ticket Já - Event Ticketing Platform 🌀 | NestJS, TypeScript, Prisma, PostgreSQL, Redis, JWT

2026

- Developed a RESTful API for ticket sales in a **modular monolith** (auth, catalog, purchase, payment, ticket, and admin), documented with **Swagger**.
- Modeled the database in **Prisma/PostgreSQL**: organizers with admin approval, venues, events with a state machine (*draft* → *published*), sectors with price/stock/sales window limited by venue capacity, coupons, and tickets.
- Implemented **JWT authentication with global RBAC** (buyer/organizer/admin), rotating refresh tokens with revocation, resource ownership validation, and *rate limiting* across multiple windows with **Redis**.
- In the purchase flow, I use a **single transaction with atomic stock decrement** (prevents overselling under concurrency), subtotal/fee/discount calculation, atomic coupon consumption, and ticket generation; payment approved/rejected by the admin restores stock and cancels tickets.
- Developed ticket validation via **QR code** with idempotent status transitions, wrote **270 unit and e2e tests**, and containerized with **multi-stage Docker + Compose**.

Let Me Do It - Answer Key Correction 🌀 | Node.js, TypeScript, Vue, MongoDB, Redis, BullMQ

2025 – 2026

- Developed a Full Stack platform for automated exam correction, using the Google Gemini API for answer key analysis.
- Implemented asynchronous processing with **Redis** and **BullMQ**, decoupling long-running tasks into *workers*.
- Integrated **Cloudinary** and **Multer** for file management and storage.
- Structured the backend in layers, using **Zod** for data validation and consistent typing.
- Implemented **Retries** and **Exponential Backoff** with BullMQ for handling failures in external APIs.
- Configured **CI/CD** with **GitHub Actions**, automating typecheck, 194 unit tests, and build.

Technical Skills

Languages: Typescript, Javascript, C#, SQL

Tools: Git, Github, NodeJs, Prisma ORM, Drizzle ORM, Entity Framework, VS Code, Shell and Bash (Linux)

Frameworks: Express, Nest.JS, Vue, .NET

Testing: Jest, Vitest

Databases: MongoDB, PostgreSQL, SQLite3

Best Practices (Notions): Design Patterns, SOLID, Clean Code
